EXPERIMENT 15 – Careers and Future of Low-Code

Project: Student Academic Performance Tracker using Low-Code in Zoho Creator

AIM

To study career opportunities and future trends related to low-code application development using a Student Academic Performance Tracker project as an example.

REQUIREMENTS

- Understanding of low-code concepts.
- Student Academic Performance Tracker project summary.
- Examples of forms, reports, workflows, and integrations.

DESIGN / MODULES

Role / Area	Relevant Skills
Low-code developer	Forms, reports, workflows, data modelling
Business analyst	Requirement gathering and process mapping
Automation specialist	Workflow design, testing, integrations
Application administrator	Access control, security, release management
Solution architect	Integration design, scalability, risk assessment

PROCEDURE

1. Summarize the purpose and main modules of the Student Academic Performance Tracker.
2. Identify low-code skills demonstrated by forms, reports, workflows, validation, and dashboards.
3. Explain how developers collaborate with teachers and administrators to convert requirements into an application.
4. Discuss future-facing skills such as API integration, security, data quality, testing, and custom functions.
5. Explain that low-code reduces repetitive development but does not remove the need for design, testing, and governance.
6. Prepare a short project presentation with architecture, key workflows, limitations, and future enhancements.

SAMPLE LOGIC / OUTPUT

Future enhancements:

- Student attendance tracking.
- Automatic grade calculation and report generation.
- Performance charts and dashboards.
- Low-mark alerts for teachers and parents.
- Student progress reports.
- Secure integration with existing college management systems.

TEST CASES

Evaluation Area	Evidence to Present
Requirements	Map requirements to application modules
Automation	Demonstrate a tested grade-calculation workflow
Security	Show user roles and validation rules
Future Scope	List prioritized improvements and possible risks

RESULT

The project demonstrates practical low-code concepts and explains their relevance to careers in application development, business analysis, automation, administration, and solution architecture. It also highlights future opportunities in API integration, analytics, security, and workflow automation.
