EXPERIMENT 12: SECURITY AND GOVERNANCE

Project: Hotel Booking Using Low-Code in Zoho Creator

AIM

To identify security controls and governance practices for protecting guest and booking information in Zoho Creator.

REQUIREMENTS

- Configured user roles
- Sample guest and booking records
- Access to application settings and available audit features

DESIGN / MODULES

Control	Purpose
Least Privilege	Give each role only the permissions it needs
Input Validation	Validate dates, guest count, and required details
Sensitive Data	Avoid collecting unnecessary personal information
Audit and Review	Review available activity history and changes
Backup and Recovery	Document how records and configurations can be restored

PROCEDURE

1. Identify the personal and booking information collected by the application.
2. Restrict access to guest details and administrative reports according to user roles.
3. Validate check-in and check-out dates, guest count, and required contact fields.
4. Store API tokens and connection secrets securely; do not hard-code them in visible fields or shared documents.
5. Review the available audit and activity features and document the information they record.
6. Prepare a backup and recovery procedure suitable for Zoho Creator.
7. Test access restrictions, validation, and recovery procedures safely in a test environment.

SAMPLE LOGIC / OUTPUT

Sample Deluge Logic for Date Validation:

```
if(input.Check_In >= zoho.currentdate && input.Check_Out > input.Check_In)
{
    info "Valid booking dates";
}
else
{
    alert "Invalid check-in or check-out dates";
}
```

Note: Configure this logic in the appropriate form workflow and verify the field link names in the application.

Security Checklist:

- Minimum personal data collected
- User roles and permissions tested
- Guest records and restricted reports protected
- API secrets stored securely
- Input validation enabled
- Audit features reviewed
- Backup and recovery plan documented

TEST CASES

Test Case	Expected Outcome
Guest attempts to view another guest's record	Access denied unless explicitly authorized
Check-out date is before check-in date	Validation rejects the record
Unauthorized user opens the admin page	Access denied
User enters an invalid guest count	Validation displays an error
Authorized administrator accesses booking reports	Access allowed according to assigned permissions

RESULT

A security and governance checklist was prepared for the Hotel Booking application in Zoho Creator. Platform-specific audit, backup, and restore capabilities must be confirmed and tested in the actual account before being considered operational.
